ABSTRACT

The Legal Document Repository is a Java-based system designed to efficiently store, organize, and retrieve large collections of legal documents such as case files, judgments, petitions, and legal notices. The system provides keyword-based searching to help users quickly locate relevant documents from a corpus of legal text. The core of the project focuses on implementing efficient string matching algorithms, particularly the Knuth-Morris-Pratt (KMP) and Rabin-Karp algorithms, for searching patterns within document content. These algorithms are implemented and evaluated using project-specific legal document data files (corpus) to demonstrate their effectiveness in text retrieval.

The system also supports basic document management operations such as adding, viewing, updating, and deleting documents. The project demonstrates the application of advanced string-processing techniques from Data Structures and Algorithms-3 to solve a practical document-retrieval problem efficiently.
